Throughout my life, innovation has been something I have strived for. I once had a school project where all my classmates followed a specific template. They hand out brochures, read their PowerPoint presentation, and show their recourses on the last slide. I wanted our project to stand out since our teacher was notoriously hard to impress; I did that by creating a website that included not only links to our resources but also a downloadable version of our slides and our research paper. That modification to the project's pattern led us to be the only project to get a full mark, and it taught me the power of innovation. Programming a web page will appear demanding for someone with no experience like me, but then I saw the joy in the complication. That's when I knew I wanted to become a Computer Scientist.

I wish to major in Computer Science for countless reasons, one being that I've always been a builder. Most of my joyful memories started from my passion for building LEGOs, which grew when I got into robotics and constructed logic gates, then shifted towards composing websites that are still up to this date. Another reason is that computer scientists benefit society in various aspects. They graduate to become database administrators, game designers, and software developers, which is the path I'm aiming to take. It was when I volunteered to build a health organization's website that I gained extensive experience. It familiarized me with programming, which enthused me to achieve my goal of making software.

Secondary school is where I discovered most of my hobbies, some of which included making YouTube videos, designing illustrations, and playing video games, but my interests were primarily athletic. I believe basketball changed my life; this sport taught me excellent communication and teamwork skills that built up my character today. After winning multiple trophies and medals from tournaments and local events, I learned that hard work and practice always pay off.

Looking for a college is like looking for a new home. That's why when searching for the right college, I picked the ones that are eminent for their excellent tutoring and healthy environment. The challenges ahead will be enormous, but my efforts will match. Studying abroad will give me all I desire; adding to that, I'll be expanding my worldview and boosting my independence.

In short, the knowledge acquirable by learning Computer Science will allow me to leave a positive mark on this world and benefit society. Studying this subject at leading universities will let me socialize amongst other elite students and develop my employability skills for my future career. At last, I'm hoping to study computer science because it's the ideal major for innovative minds.
