

As we all know, technology has become the key to our world, and the internet has become a very important foundation in society, making life on Earth easier and simpler. My interest in Computer Science grew to a new level after the 2030 vision. As a child growing up in a developing environment and one of the most innovative countries, Saudi Arabia, with new and upcoming projects and programs that piqued my interest such as The Line and Neom because of the contribution of technology and computer science to these new developments, I decided to venture deeper into the subject by attending events in various fields that would help me investigate further into the subject I want to study.

I am eager to learn more about development and would like to focus more on developing tools, systems, and processes. I understand complex theories rapidly because I love math and programming languages. I have a lot of creative ideas and projects that I expect to finish. To help further my understanding of the subject I attended conventions such as (SPE) society of petroleum engineers, which discussed the development of engineering, technologies, and sustainability. Or by taking trips to destinations like King Abdullah City For Atomic And Renewable Energy, as I was keen to learn more about energy and computer science within renewable energy but also how technologies that contribute to the environment. And how it could assist to advance and improve our future societies. Also, by reading articles in courses such as the Misk five essential skills in cyber security, which discusses operating with software, hidden codes, digital forensics, as well as firewalls, and also by listening to podcasts concerning AI such as the one by Dr. Najwa Alghamdi through Misk about Artificial intelligence and systems, which spoke about the new era of technology and how to utilize AI to better human life and make tasks easier, which is a main goal of the 2030 vision.

In my final year of high school, I received a 99% and graduated in 2021. I am driven to be the best and a leader at what I do. I'm eager to learn and grow in my field. I aspire to begin with this world-changing major and work my way up as my career and knowledge progress. I want to look for opportunities and projects that will allow me to work with like-minded individuals and contribute to their success, and create my own.
