

## Personal statement:

My interests in science extend as far as I can remember. At the pre-graduation stage I was very interested in scientific subjects, after which I decided to study electrical engineering at the bachelor's level. During the bachelor's degree, I was more interested in artificial intelligence, autonomous systems and drones. As an extension of this interest, I founded a student club at the university called "**DRONES&AUTONOMOUS SYSTEM CLUB**" to explore and develop creative students in this field. In my last year as a university student I worked on a graduation project called "**PROACTIVE DETECTION OF CAMELS MOVEMENT USING UAV**" using artificial intelligence, and I got the best project in the College of Engineering. I am very interested in completing my postgraduate studies in the scientific fields especially at British universities because of their excellence in this field. To provide the world with all its knowledge and contribution to facilitating human life. By continuing my education in the postgraduate program, I can gain more practical experience along with respected professors before adventure in the real world.
