Personal Statement

In my younger years up until my first year in high school, I was very good at mathematics. There was something discouraging to me whenever I solve a problem and that is the variables in these equations means nothing to me. I was also very good at science because I like to explore everything and the reasons of why anything happens. However, it was mostly memorizing informations and not a lot of brain picking. In my first year in high school I discovered Chemistry, which I had heard of but no one around me knew exactly what it is. I was amazed by it, and every lesson was an adventure for me, because it linked the variables in mathematics to science and suddenly everything started to make sense to me. That is why I chose Chemistry as my major in college.

During my study in college, day by day and year by year I was very disappointed, because my college didn't have the resources to back what it teaches into something tangible. All we did in the lab was simple experiments and by my last year I had the pleasure of training in the central water laboratory in my region. I saw some instruments that I only saw in books and the internet such as HPLC, GC-MS and ICP-MS and some other instruments. Although, I didn't have the opportunity to work on them and only worked on simple instruments such as Spectrophotometer and conductivity & pH meter due to its high cost and the responsibilities the college didn't want to take. Being able to see these instruments and not work on them was very aggravating.

After getting my bachelor degree with excellence, all want to get is the opportunity to work with other people on these instruments in the future because I want to be in a research and development team. My interests are researching and developing drugs that help people to have better lives. Getting my master degree and ultimately my Ph.D. Would help me get to what I aspire to become, and I believe I would help make the world a better place.

In the end, I believe in continuous learning and education. Getting the most experience I can get in this life is my first goal. The second is being able to give the knowledge I am going to acquire over the years to the next generations.
